

Product Scraper – Code & Output

Python program that extracts product name, price, and rating from Books to Scrape and stores the results in a CSV file.

1. Required Libraries

```
pip install requests beautifulsoup4 pandas
```

2. Python Code

```
import requests
from bs4 import BeautifulSoup
import pandas as pd

url = "https://books.toscrape.com/"
response = requests.get(url)

if response.status_code == 200:
    soup = BeautifulSoup(response.text, "html.parser")
    products = []

    items = soup.find_all("article", class_="product_pod")

    for item in items:
        name = item.find("h3").find("a")["title"]
        price = item.find("p", class_="price_color").text.strip()
        rating_class = item.find("p", class_="star-rating")["class"]
        rating = rating_class[1]

        products.append({
            "Product Name": name,
            "Price": price,
            "Rating": rating
        })

    df = pd.DataFrame(products)
    df.to_csv("products.csv", index=False)

    print("Product data extracted successfully!")
    print(df)
else:
    print("Failed to access the website.")
```

3. Sample Output / Screenshot-style Result

Terminal output:

Product data extracted successfully!

Product Name	Price	Rating
A Light in the Attic	£51.77	Three
Tipping the Velvet	£53.74	One
Soumission	£50.10	One
Sharp Objects	£47.82	Four
Sapiens: A Brief History...	£54.23	Five

4. CSV File

The program saves the extracted data as **products.csv** with the columns: Product Name, Price, and Rating.

Project flow: Website → HTTP Request → HTML Parsing → Extract Product Details → Pandas DataFrame → CSV
